- AC power supply: 85-120Vac monophase or triphase;
- DC logic supply: 24 Vdc (mandatory and isolated);
- Phase current: up to 8 Arms (11.3 Apk)
- Chopper frequency: ultrasonic 40KHz;
- Stepless Control Technology (65536 position per turn)
- Protections against: over current, over/under voltage, overheating, short circuit between motor phase-to-phase and phase-to-ground;
- EtherCAT communication interface
- Incremental Encoder Input: 5V Differential (RS422) or 5V single-ended TTL/CMOS
- Incremental Encoder Output: 5V Differential (RS422)
- Absolute Encoder Input: 5V BISS-C or SSI interface
- Service SCI interface for programming and real time debugging
- Safe Torque Off (STO) inputs (opto-coupled)
- 4 digital inputs (opto-coupled)
- 3 digital outputs (opto-coupled)
- Dimensions: 196.6 x 136.6 x 47 mm (without connectors);
- Protection degree : IP20;
- Pollution degree 2
- Overvoltage Category III
- Working temperature 5°C ÷ 40°C ; Storage temperature -25°C ÷ 55°C ;
- Humidity : 5% ÷ 85% not condensing;

## Service SCI connection

This connection is **only** possible with hardware and software provided by Ever.  
Kit code: SW5\_SERV00-SL or SW5-SERV00-EE.

## Dip-Switched Settings

**NOTE:** the device reads the Dip-Switches only during the Power up.  
If it's necessary a setting change, shut down the system, change the settings and start up the system again to make the changes operating.

The default configuration of the DIPs is:  
- DIP1.5 and DIP1.8 = ON and other contacts DIP1 = OFF  
- all contacts DIP2 = OFF

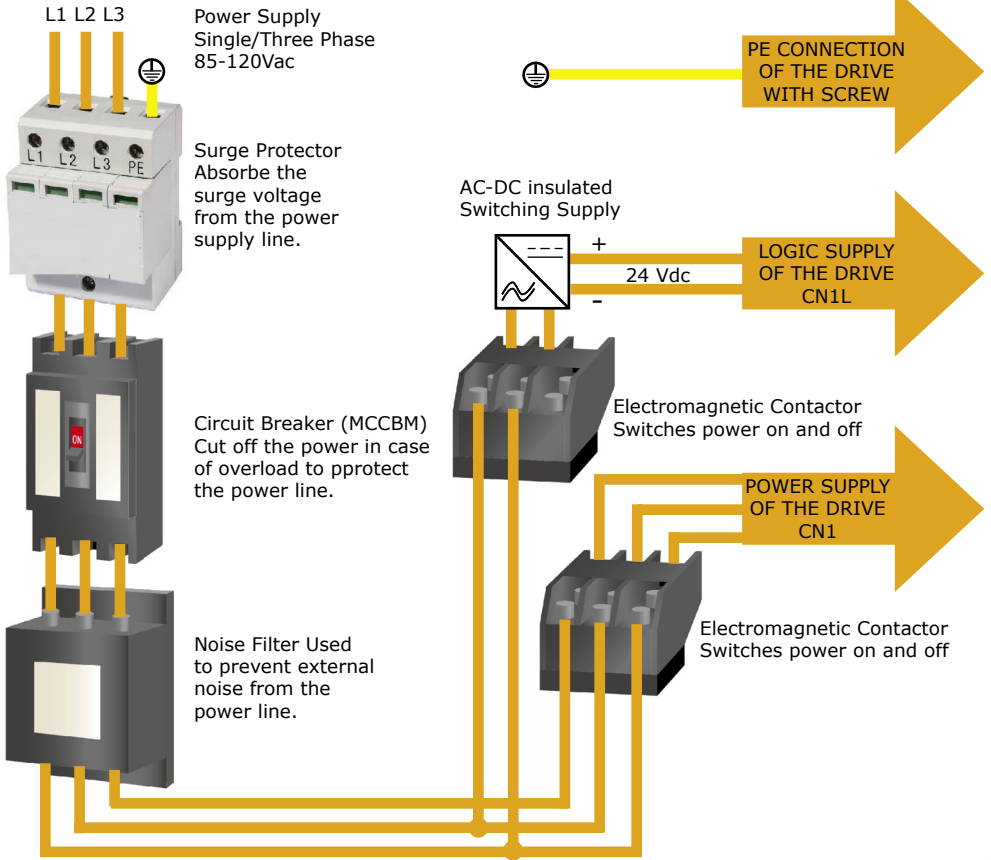

The functionality of the Dip-Switches depends on the Firmware installed on the drive (Refer to the Software Manual).

## Display Status

### Operational statuses and their signals

	Missing Operating System: no software application stored on drive
	Firmware update: Updating of new software in progress.
	Initialization: the drive executes the start-up procedure (a few seconds after the start-up procedure has begun).
	Correct functioning
	Voltage of the DC bus near to the limit value (minimum or maximum)
	Drive temperature is near to the maximum value
	Warning: EEPROM near Write Overrun
	Warning: EEPROM near End of Life
flashing	Enable OFF, current zero
flashing	$I_{nominal}$ not computed
+	Error: expired eePLC software trial
+	Error: Security intervention of watchdog
+	Error: Internal Software Error
+	Error: Missing calibration values
+	Error: Management EEPROM
+	EEPROM fail
+	Error: eePLC application error
+	Error: EEPROM Write Overrun
+	Error: Feature Unavailable (the application tried to use a feature that is not available in the current drive configuration)
+	Open motor phases
+	Over/under voltage
+	Over current on the motor output
+	Over temperature of the drive

## Power & Logic Supply connections

## Absolute Encoder input connection

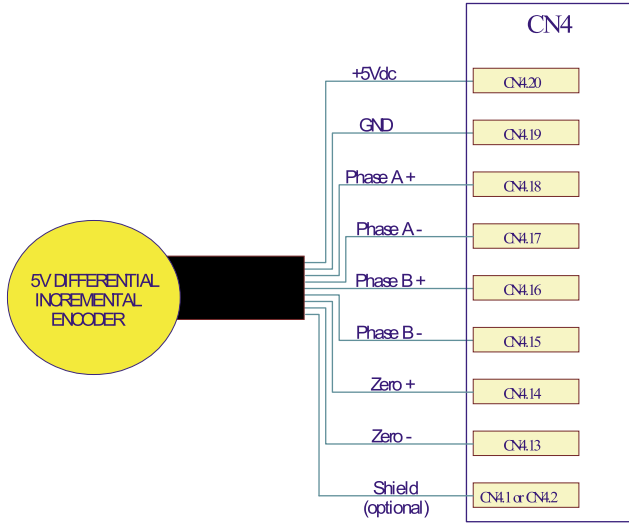

(Maximum supply current 100mA)  
Differential 5Vdc digital inputs that meet the RS422 standard.

## Incremental Encoder input connection

(Maximum supply current 100mA)

Differential 5Vdc digital inputs that meet the RS422 standard.

Single-Ended 5Vdc TTL/CMOS digital inputs

## Incremental Encoder output connection

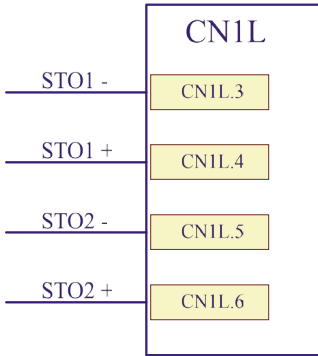

Outputs reports the used interface for encoder input : Differential or Single-Ended.

Differential 5V digital outputs that meets RS422 standard.

# Safe Torque Off inputs (STO)

2 terminals, 24V compatible (optoisolated)

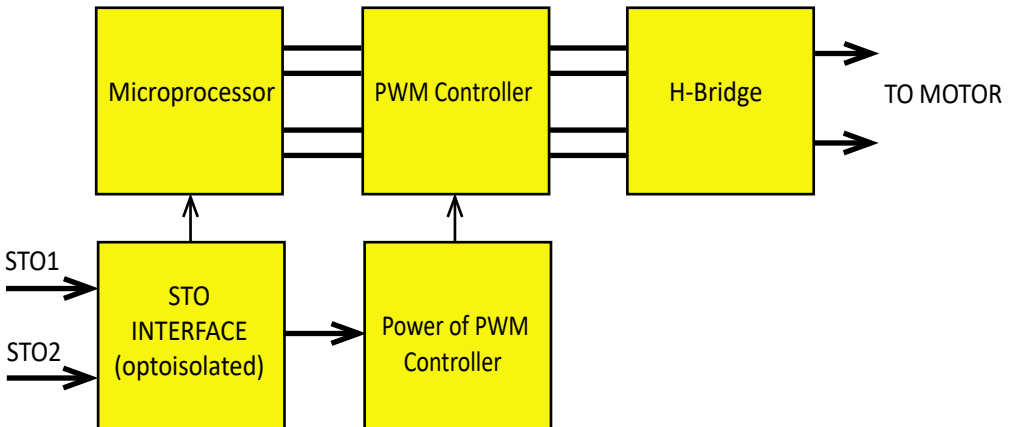

STO1	STO2	Drive Status	Motor Status
+24Vdc	+24Vdc	Enable	SW controlled
+24Vdc	Not connected	Disable	Stop for inertia
Not connected	+24Vdc	Disable	Stop for inertia
Not connected	Not connected	Disable	Stop for inertia

The drive has a safety feature that is designed to provide the Safe Torque Off (STO) function as defined in IEC 61800-5-2. Two input signals are provided which, when not connected, prevent the upper and lower devices in the PWM outputs from being operated by the digital control core. This provides a positive OFF capability that cannot be overridden by the control firmware, or associated hardware components. When both STO signals are activated (current is flowing in the input diodes of the optocouplers), the control core will be able to control the on/off state of the PWM outputs.

- i** If not using the STO feature, both signals must be connected to a 24Vdc supply in order enabled the drive.
- i** If a drive in operation mode is disabled by STO signal, it immediately finish to produce torque but the motor continues to run by inertia until it can stop.

Principle of operation:

# Digital inputs connection

Differential PNP, NPN and Line Driver type.

## Verify the installation

- Check all connection: power supply, logic supply, STO inputs and inputs/outputs
- Make sure all settings right for the application.
- Make sure the power supply is suitable for the drive.
- If possible, remove the load from the motor shaft to avoid that wrong movements cause damage.
- Enable the current to the motor and verify the applied torque.
- Enable a movement of some steps and verify if the rotation direction is the desired one.
- Disconnect the power supply, connect the load on the motor and check the full functionality.

## Analysis of malfunctions

**When one of the following situations occur, the drive doesn't function correctly and it is reported an error.**

DEFECT	CAUSE	ACTION
The external fuse to the drive burns	May be due to a wrong connection of the power supply.	Adjust the connection and recover the fuse. Use a fuse suitable for the application.
Over temperature protection.	May be due to a duty cycle	Increase the air flux and if it is possible chose a motor with higher torque at same current value.
Over current protection.	May be due to a short circuit on the motor power stage.	Shut down the power supply and check if the motor is damaged
Noisy motor movement with vibrations.	May be caused due to a state of resonance.	Increase the resolution of the step angle and/or change the motor velocity to avoid resonance area
The motor produce torque but doesn't rotate	May be caused due to a wrong connection of the I/O's.	Check the connection of the I/O's
